

## Integrated Algebra 2013

Topic: Modeling with Functions Unit 1				
Essential Questions: How can we model real life situations with a graph? What situations can be modeled with a function? When will the relationship between to quantities be linear? When will it not?				
Performance Indicators	Guided questions	Essential Knowledge and Skills	Classroom Ideas (Instructional Strategies)	Assessment Ideas (evidence of understanding)
<p><b>Quantities N-Q</b>  <b>Reason quantitatively and use units to solve problems.</b>            1. Use units as a way to understand problems and to guide the solution of multi-step problems; choose and interpret units consistently in formulas; choose and interpret the scale and the origin in graphs and data displays.            2. Define appropriate quantities for the purpose of descriptive modeling.            3. Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.</p> <p><b>Interpreting Functions F-IF</b>  <b>Understand the concept of a function and use function notation.</b>            1. Understand that a function from one set (called the domain) to another set (called the range) assigns to each element of the domain exactly one element of the range. If <math>f</math> is a function and <math>x</math> is an element of its domain, then <math>f(x)</math> denotes the output of <math>f</math> corresponding to the input <math>x</math>. The graph of <math>f</math> is the graph of the equation <math>y = f(x)</math>.            2. Use function notation, evaluate</p>		<p>Students will know :</p> <p>Rate relates to 2 quantities            The difference between constant rates of change and non-linear rates of change and be able to explain why a line results from a constant rate of change            Graphs show the relationship between 2 quantities            The definition of a function and explain how functional relationships are different from other relationships</p> <p>Students will be able to :</p> <p>Select appropriate units and round correctly            Calculate rates of change form verbal descriptions and from graphs            Use dimensional analysis and/or proportions to convert from 1 unit to another            Choose and create an appropriate scale in a graph            Identify key features of a graph (rate, intercepts, maximums and minimums, quadrant and end behavior) and interpret these in the context of the given quantities            Identify and relate the domain of a function to its graph and why a domain is appropriate for a given situation</p>		<p>Quizzes            Test            P.O.D.            In-class activities            HW</p>

<p>functions for inputs in their domains, and interpret statements that use function notation in terms of a context.</p> <p>3. Recognize that sequences are functions, sometimes defined recursively, whose domain is a subset of the integers. <i>For example, the Fibonacci sequence is defined recursively by <math>f(0) = f(1) = 1</math>, <math>f(n+1) = f(n) + f(n-1)</math> for <math>n \geq 1</math>.</i></p> <p><b>Interpret functions that arise in applications in terms of the context.</b></p> <p>4. For a function that models a relationship between two quantities, interpret key features of graphs and tables in terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. <i>Key features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative maximums and minimums; symmetries; end behavior; and periodicity.</i></p> <p>5. Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. <i>For example, if the function <math>h(n)</math> gives the number of person-hours it takes to assemble <math>n</math> engines in a factory, then the positive integers would be an appropriate domain for the function</i></p> <p>9. Compare properties of two functions each represented in a different way (algebraically, graphically, numerically in tables, or by verbal descriptions). <i>For</i></p>		<p>Write the given domain and range as an interval or using set builder notation</p> <p>Identify functions and non-functions in graphs, tables and sets of points</p>

## Integrated Algebra 2013

Topic: Linear Equations and Inequalities in One Variable Unit 3					
Essential Questions: How do equations and inequalities differ from expressions? How are linear equations related to linear functions? Do we use different mathematical procedures when working with inequalities? What does it mean to solve an equation or inequality? What does it mean to balance an equation or inequality? What type of problems require you to use a different procedure for solving equations?					
Performance Indicators	Guided Questions		Essential Knowledge and Skills	Classroom Ideas (Instructional Strategies)	Assessment Ideas (evidence of understanding)
<p><b>Reasoning with Equations &amp; Inequalities A-REI</b>  <b>Understand solving equations as a process of reasoning and explain the reasoning.</b>                      1. Explain each step in solving a simple equation as following from the equality of numbers asserted at the previous step, starting from the assumption that the original equation has a solution. Construct a viable argument to justify a solution method.</p> <p><b>Solve equations and inequalities in one variable.</b>                      3. Solve linear equations and inequalities in one variable, including equations with coefficients represented by letters                      11. Explain why the <math>x</math>-coordinates of the points where the graphs of the equations <math>y = f(x)</math> and <math>y = g(x)</math> intersect are the solutions of the equation <math>f(x) = g(x)</math>; find the solutions approximately, e.g., using technology to graph the functions, make tables of values, or find successive approximations. Include cases where <math>f(x)</math> and/or <math>g(x)</math> are linear, polynomial, rational, absolute value, exponential, and logarithmic functions.</p>			<p>Students will understand :</p> <p>How to create an equation from information (verbal, graph, table etc)</p> <p>What each part of an equation represents</p> <p>Different types of equations can be used to model different situations</p> <p>How to manipulate equations in order to solve for a specific quantity</p> <p>Solutions mean different things in different contexts</p> <p>What absolute value is</p> <p>Linear equations connect to linear functions</p> <p>The difference between equations and expressions</p> <p>Students will be able to:</p> <p>Solve 1 variable linear equations</p> <p>Solve 1 variable inequalities</p> <p>Determine which types of equations can be used to model different situations</p> <p>Translate sentences into equations and inequalities</p> <p>Manipulate equations</p> <p>Identify solutions to an equation or inequality given a replacement set</p> <p>Solve absolute value linear</p>		<p>Quizzes</p> <p>Test</p> <p>P.O.D.</p> <p>In-class activities</p> <p>HW</p>

<p><b>Creating Equations A-CED</b>  <b>Create equations that describe numbers or relationships.</b>  1. Create equations and inequalities in one variable and use them to solve problems. 3. Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret solutions as viable or nonviable options in a modeling context. <i>For example, represent inequalities describing nutritional and cost constraints on combinations of different foods.</i>  4. Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. <i>For example, rearrange Ohm's law <math>V = IR</math> to highlight resistance <math>R</math>. Include equations arising from linear and quadratic functions, and simple rational and exponential functions.</i></p>		<p>inequalities</p>
